

Read each question completely before answering. Each question is worth 2 points except as noted.

Circle True or False. Read each statement completely before answering.

1. True **FALSE** Disease is not a factor that could regulate biological populations.
2. True **FALSE** A sink population has more births than deaths.
3. True **FALSE** By adding eggs to an American Kestrel's nest, ecologists found that adult survival increased.
4. **TRUE** False Collared lemmings self-regulate their populations by mass suicide.
5. **TRUE** False An insect that has evolved to resemble a plant twig will have a better chance of avoiding predation.
6. True **FALSE** Richness measures only the number of different species in a population.
7. **TRUE** False Any one trophic level supports on average about 10% of the biomass of the next lower trophic level.
8. True **FALSE** Competitive exclusion will occur when two species use even one identical resource out of many resources.
9. **TRUE** False The brightly colored pattern of poison dart frogs is an example of aposomatic coloration.
10. True **FALSE** A field containing 30,000 kg of plant biomass will support about 300 kg of tertiary consumer biomass.

11. (4 points) In population ecology, what does BIDE stand for?

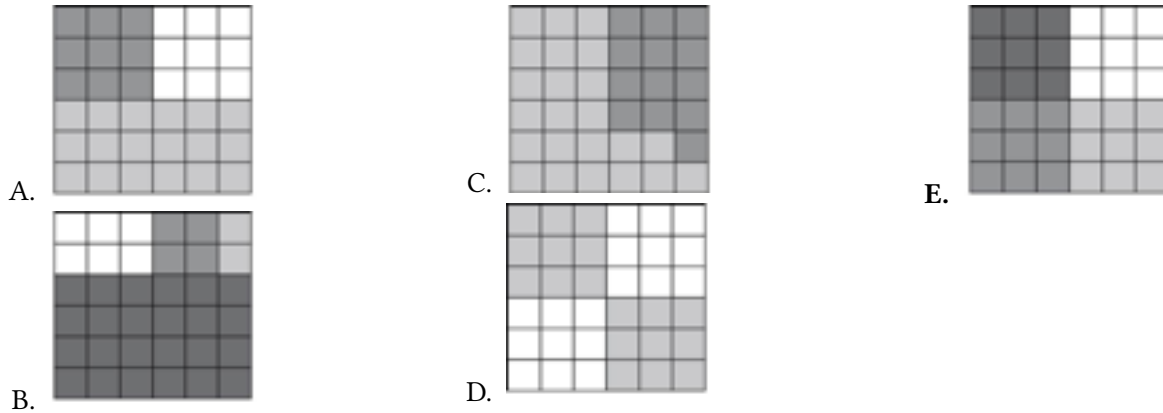

Births, immigration, deaths, emigration. 1 point per term.

Multiple choice. Choose the *best* answer. Clearly circle the letter for your answer. Vague or unclear marks will be counted as incorrect.

12. One form of elephantiasis occurs when *Brugia malayyi*, a thread-like worm, invades human lymph nodes. The worm blocks the flow of lymph throughout the body, causing massive swelling of the lower body, especially legs and genitals. As described here, this is an example of
- A. predation.
 - B. parasitism.**
 - C. mutualism.
 - D. commensalism.
 - E. symbiosis.
-

13. A field containing 2000 kg of plant material can support about _____ of tertiary consumers.
- A. **2 kg**
 - B. 10%
 - C. 10 kg
 - D. 20 kg
 - E. 90%
 - F. 200 kg
14. Energy from the sun is converted into chemical energy for organisms by
- A. carnivores.
 - B. **primary producers.**
 - C. herbivores.
 - D. decomposers.
 - E. primary consumers.
15. Competitive exclusion means that
- A. one population will always exclude another another population of the same species in a community.
 - B. two species will partition resources to eliminate competition.
 - C. **one species will always out complete another species that occupies the same niche.**
 - D. one individual will always out complete another individual in a population.
 - E. a species will have a smaller realized niche than a fundamental niche.
16. Organisms that break down organic material and make it available to other organisms are called
- A. scavengers.
 - B. **decomposers.**
 - C. consumers.
 - D. producers.
 - E. degraders.
17. The “role” or “job” of a species in a community, represented by all of the resources needed by the species, is called
- A. a predator.
 - B. **the niche.**
 - C. the resource.
 - D. a predator or prey.
 - E. a producer or consumer.
-

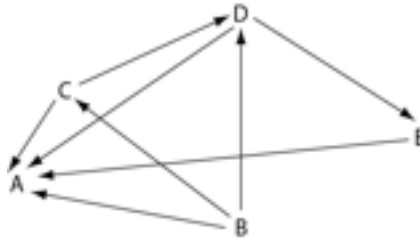

18. Which block in the figure below shows the greatest species diversity? (Different shades, including white, represent different species. The small squares indicate relative abundance of individuals present.)

19. Probably the most important factor(s) affecting the global distribution of ecosystems is (are)
- longitude and latitude.
 - wind and ocean water current patterns.
 - climate.**
 - wind direction and rain shadows.
 - day length and rainfall.
20. Colors and patterns that helps an animal blend in with its environment is called
- habitat mimicry.
 - aposematic coloration.
 - cryptic coloration.**
 - environmental mimicry.
 - warning coloration
21. An organism that only reproduces once is known as
- ectotherm.
 - iteroparous.
 - semelparous.**
 - perennial.
22. What type of survivorship curve describes a species that has a high rate of juvenile mortality but low adult mortality?
- Type I curve.
 - Type II curve.
 - Type III curve.**
 - Type IV curve
-

23. Based on the hypothetical food web below, one letter represents an organism that could be both a secondary and tertiary consumer? The arrows point in the direction of energy transfer from lower to higher trophic levels. More than one answer is possible. Circle only one answer.

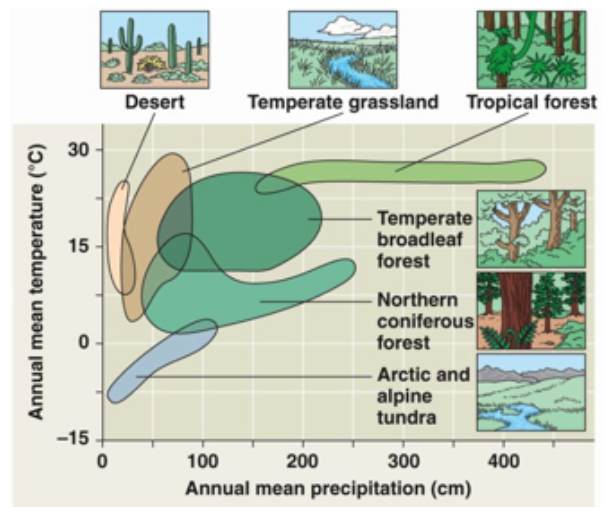

- A. A
- B. B
- C. C
- D. D
- E. E

24. Of the following choices, which is the biggest concern about climate change?
- A. More regions around the globe will experience stronger rain shadows.
 - B. The average global temperature will be warmer than ever recorded.
 - C. The rate of temperature increase is faster than ever recorded.**
 - D. The amount of solar radiation will change faster than plants can adapt.
 - E. Forest and grassland ecosystems will die due to less CO₂ available for photosynthesis.
 - F. More regions around the globe will experience desert-like conditions.
25. Early successional species add nutrients and deepen the soil, allowing intermediate successional species to colonize an area. This process is known as
- A. disturbance.
 - B. inhibition.
 - C. tolerance.
 - D. primary succession.
 - E. facilitation.**
 - F. secondary succession.
26. The difference between communities and ecosystems is that
- A. communities are groups of individuals of the different species; ecosystems are groups of communities.
 - B. communities include individuals of the same species; ecosystems include individuals of different species.
 - C. communities include interactions between individuals and their physical environment; ecosystems do *not* include such interactions.
 - D. communities include individuals of the different species; ecosystems are individuals of the same species.
 - E. communities do *not* include interactions between individuals and the physical environment; ecosystems do include such interactions.**
27. Which dispersion should be favored among plants that compete intraspecifically by casting shade?
- A. Random.
 - B. Clumped.
 - C. Clustered.
 - D. Evenly spaced.**

28. Which statement most accurately describes how nutrients and energy are used in ecosystems?
- A. Nutrients can be converted into energy; energy cannot be converted into nutrients.
 - B. Energy flows through ecosystems; nutrients cycle within ecosystems.**
 - C. Nutrients flow through ecosystems; energy cycles within ecosystems.
 - D. Nutrients are used in ecosystems; energy is not.
 - E. Energy can be converted into nutrients; nutrients cannot be converted into energy.
29. White-breasted nuthatches and brown creepers both eat insects that hide in the furrows of bark in hardwood trees. The brown creeper searches for insects by hunting from the bottom of the tree trunk toward the top, whereas the white-breasted nuthatch searches from the top of the trunk down. Their feeding areas rarely overlap on the tree trunk. These hunting behaviors best illustrate which of the following ecological concepts?
- A. resource partitioning**
 - B. keystone species
 - C. competitive exclusion
 - D. interspecific competition
 - E. intraspecific competition
30. Fire suppression by humans
- A. is necessary for the protection of threatened and endangered forest species.
 - B. will result ultimately in sustainable production of increased amounts of forest products for human use.
 - C. can change the species composition within biological communities.**
 - D. is a management goal of conservation biologists to maintain the healthy condition of forest communities.
 - E. will always result in an increase in species diversity in a given biome.
31. Symbiosis is a long-term ecological interaction
- A. where both species benefit.
 - B. where one species benefits and another species is harmed
 - C. where one species benefits and the other species neither benefits nor is harmed.
 - D. between two or more species.**
 - E. where two or more species partition resources.
32. The energy that is *not* transferred to other trophic levels or decomposers is lost
- A. in fecal matter.
 - B. to primary consumers.
 - C. as metabolic heat.**
 - D. to secondary consumers.
 - E. to consumers at any trophic level.
-

33. Plants produce water vapor during photosynthesis, which goes from the plant to the atmosphere. The water vapor in the atmosphere eventually falls back to the earth as rain. This process would be part of
- energy flow.
 - the nutrient cycle.
 - the energy cycle.
 - plant metabolism.
 - the water cycle.**
 - the entire ecosystem.
34. In a population growing according to the exponential growth model, population size is
- limited by density-independent factors.
 - limited by both density-dependent and density-independent factors.
 - not limited.**
 - limited by density-dependent factors.
35. Which of the following statements about ecosystems is false?
- Water cycles within an ecosystem.
 - About 10% of the energy available at one trophic level is lost as it moves to the next higher trophic level.**
 - Carnivores occupy higher trophic levels than herbivores.
 - Nutrients, like nitrogen and phosphorus, cycle within an ecosystem.
 - Energy flows through an ecosystem.
36. According to this climograph, the temperate grassland
- never occurs with deserts.
 - has the greatest variation in precipitation of any ecosystem shown in the figure.
 - has an average annual rainfall of about 20–80 cm.
 - has an average annual rainfall of about 5–30 cm.
 - has an average annual temperature range of about 4–30°C.**

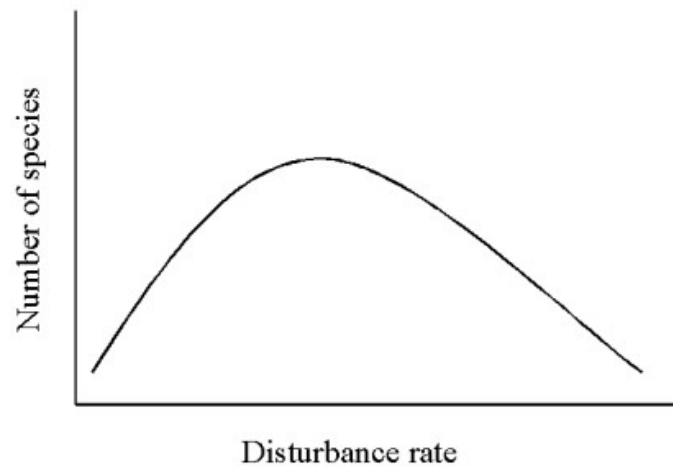

Match the *most appropriate* term to each concept. Not all terms are used. No term is used twice.

Bears	Herbivore	Primary consumer
Carrying capacity	Interspecific competition	Primary producer
Climate change	Iteroparous	Primary production
Community	Keystone species	Primary succession
Commensalism	Mountain lions	Realized Niche
Ecosystem	Mutualism	Secondary consumer
Exploitation	Net primary production	Secondary succession
Global warming	Parasitism	Semelparous
Greenhouse effect	Potential niche	Symbiosis
Gross primary production	Predator	Wolves

37. **Wolves** Hypothesized to cause population fluctuations of moose on Isle Royale
38. **Realized niche** Based on the resources actually used by a species.
39. **Greenhouse Effect** Carbon dioxide, methane, and other gasses provide insulation for Earth.
40. **Gross primary production** Total amount of sun's energy converted to organic matter.
41. **Commensalism** One species get ecological benefit over the long term, the other neither benefits or loses.
42. **Secondary consumer** Eaten by tertiary consumers.
43. **Iteroparous** An individual that is a repeat reproducer is known as this.
44. **Ecosystem** Interaction between a community and the physical environment.
45. **Keystone species** A species that greatly increases community diversity.
46. **Carrying capacity** This is the key distinction between the exponential and logistic population growth models.
47. **Primary succession** Following disturbance, begins from bare rock.

48. (4 points) Draw and properly label a graph that illustrates the intermediate disturbance hypothesis. Each axis must be labeled with what it represents but you do not need to put number scales on them. I will assume low numbers are to left (x) or bottom (y) of an axis and high numbers to the right (x) or top (y) of an axis.

Count the day as lost that you do not learn something new. Stay curious, do good things, and have a great break!
